

Input Assignment:

Instructions: In this assignment you will write a program to collect information for two payees including the following information about them (Payee Name, Account Number, Account Type, State and Country).

You will need to create variables, store the information for the two payees in these variables, and then create the appropriate built-in functions to capture the input from the user. You will then output the contents of these variables to the console.

Expanding on the previous output assignment in this assignment you are asking the user to input information for the two payees rather than adding some random static information on the two payees as in previous assignment.

You will need to submit the code and not the screen shot in the assignment submission link in order to confirm successful run.
